

CSS

Cascading Style Sheets

http://en.wikipedia.org/wiki/Cascading_Style_Sheets

The big picture...

In the modern era of web design we represent content and meaning in HTML and formatting and layout in CSS.

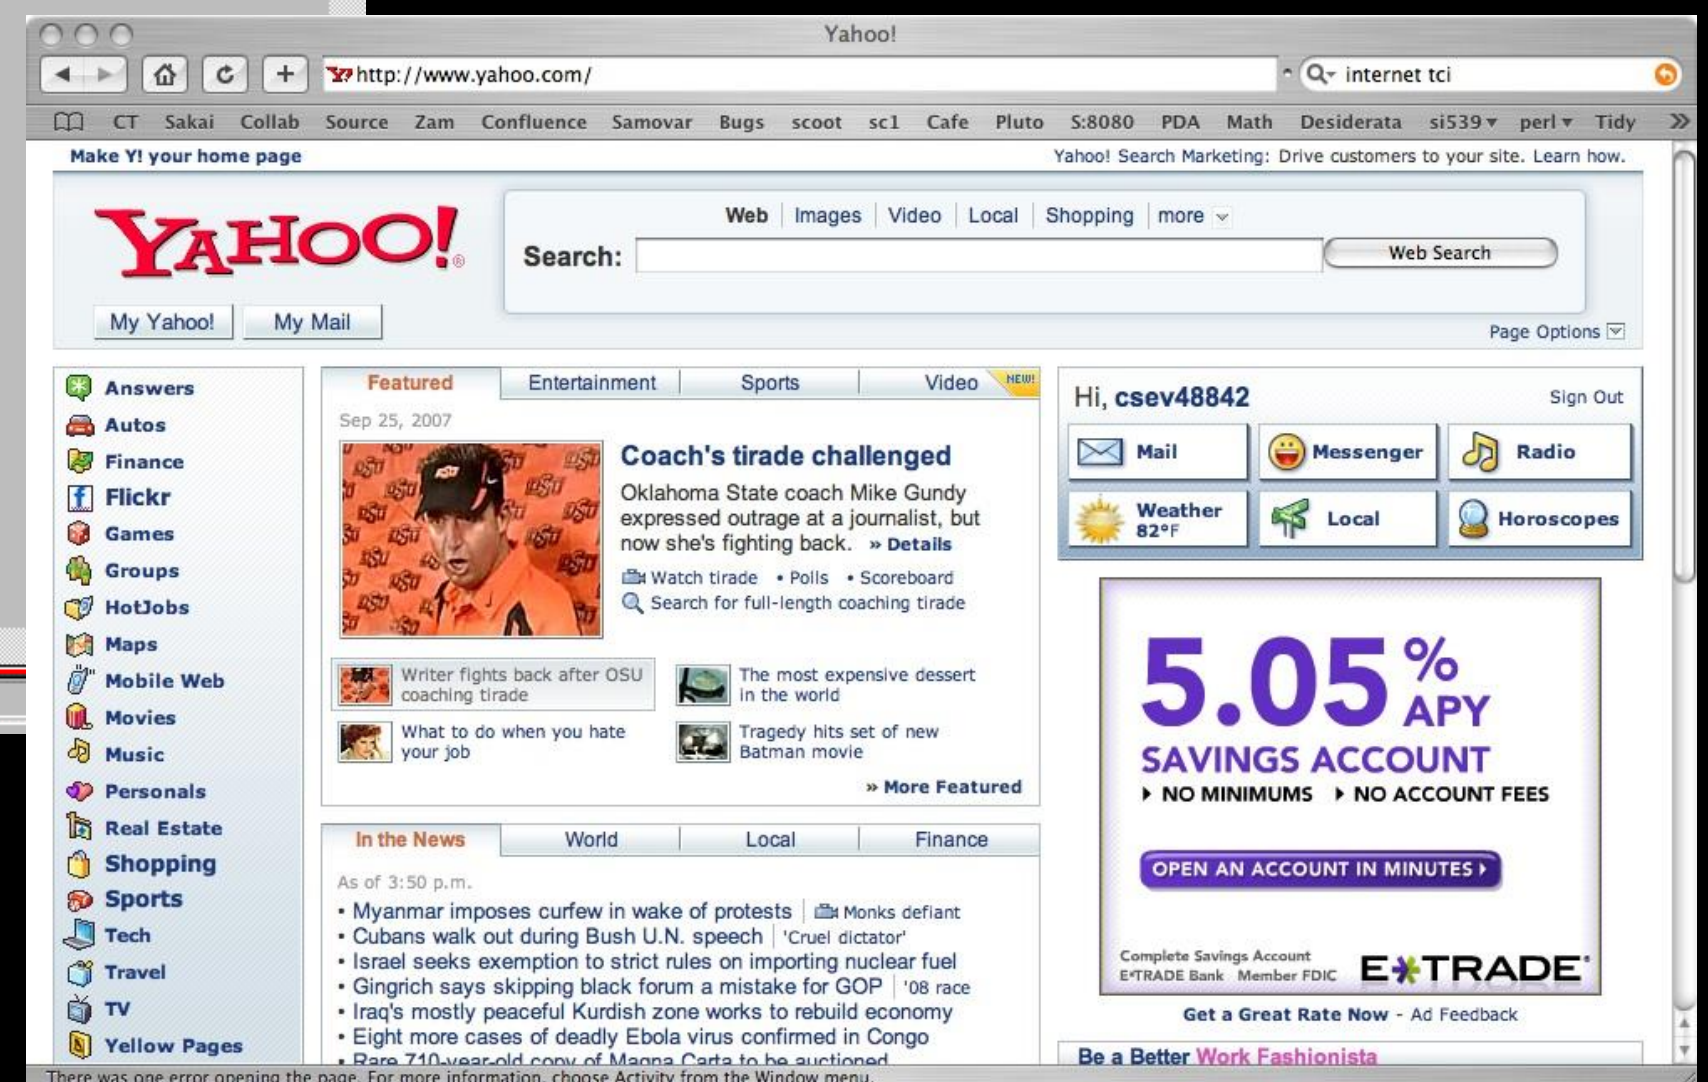

```
<!DOCTYPE html PUBLIC "-//W3C//DTD XHTML 1.0 Strict//EN"
"http://www.w3.org/TR/xhtml1/DTD/xhtml1-strict.dtd">
<html xmlns="http://www.w3.org/1999/xhtml" xml:lang="en">
<head>
<title>University of Michigan</title>
....
```

```
@import "/CSS/graphical.css"/**/;
p.text strong, .verbose, .verbose p, .verbose h2{text-indent:-
876em;position:absolute}
p.text strong a{text-decoration:none}
p.text em{font-weight:bold;font-style:normal}
div.alert{background:#eee;border:1px solid
red;padding:.5em;margin:0 25%}
a img{border:none}
.hot br, .quick br, dl.feature2 img{display:none}
div#main label, legend{font-weight:bold}
```

1995

2007

HTML has evolved a *lot* over the years - as computers and networks have gotten faster.

CSS Allows Separation of effort / specialization

Developer

```
<!DOCTYPE html PUBLIC "-//W3C//DTD XHTML 1.0
Strict//EN" "http://www.w3.org/TR/xhtml1/DTD/xhtml1-
strict.dtd">
<html xmlns="http://www.w3.org/1999/xhtml" xml:lang="en">
<head>
<title>University of Michigan</title>
....
```

Designer

```
@import "/CSS/graphical.css"/**/;
p.text strong, .verbose, .verbose p, .verbose h2{text-
indent:-876em;position:absolute}
p.text strong a{text-decoration:none}
p.text em{font-weight:bold;font-style:normal}
div.alert{background:#eee;border:1px solid
...

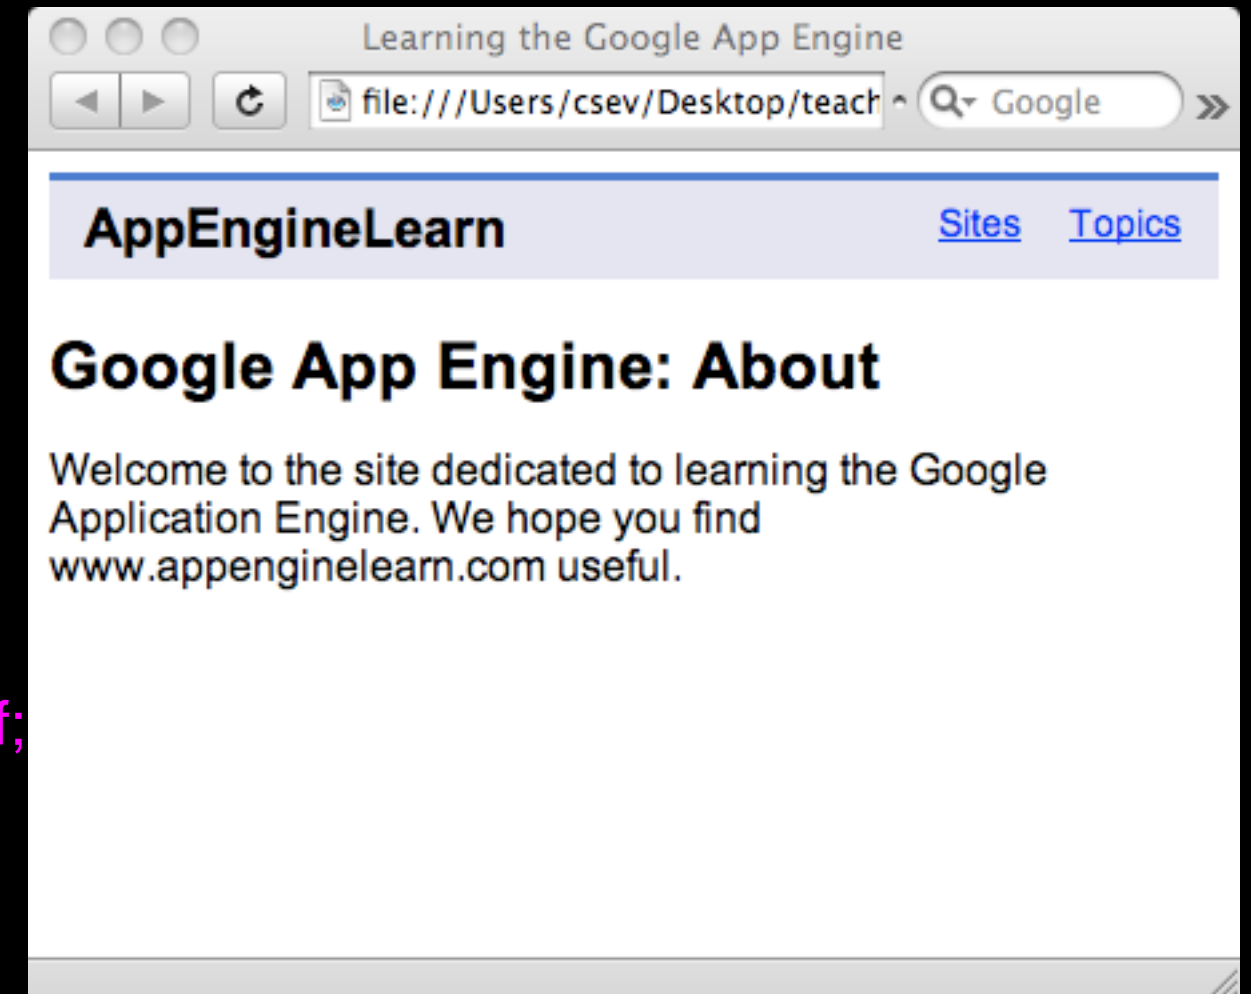

```

Everyone needs to know some HTML and some CSS and some programming - but to be truly skilled at a professional level requires deep understanding and specialization.

Transforming the look and feel of a page using a CSS style sheet.

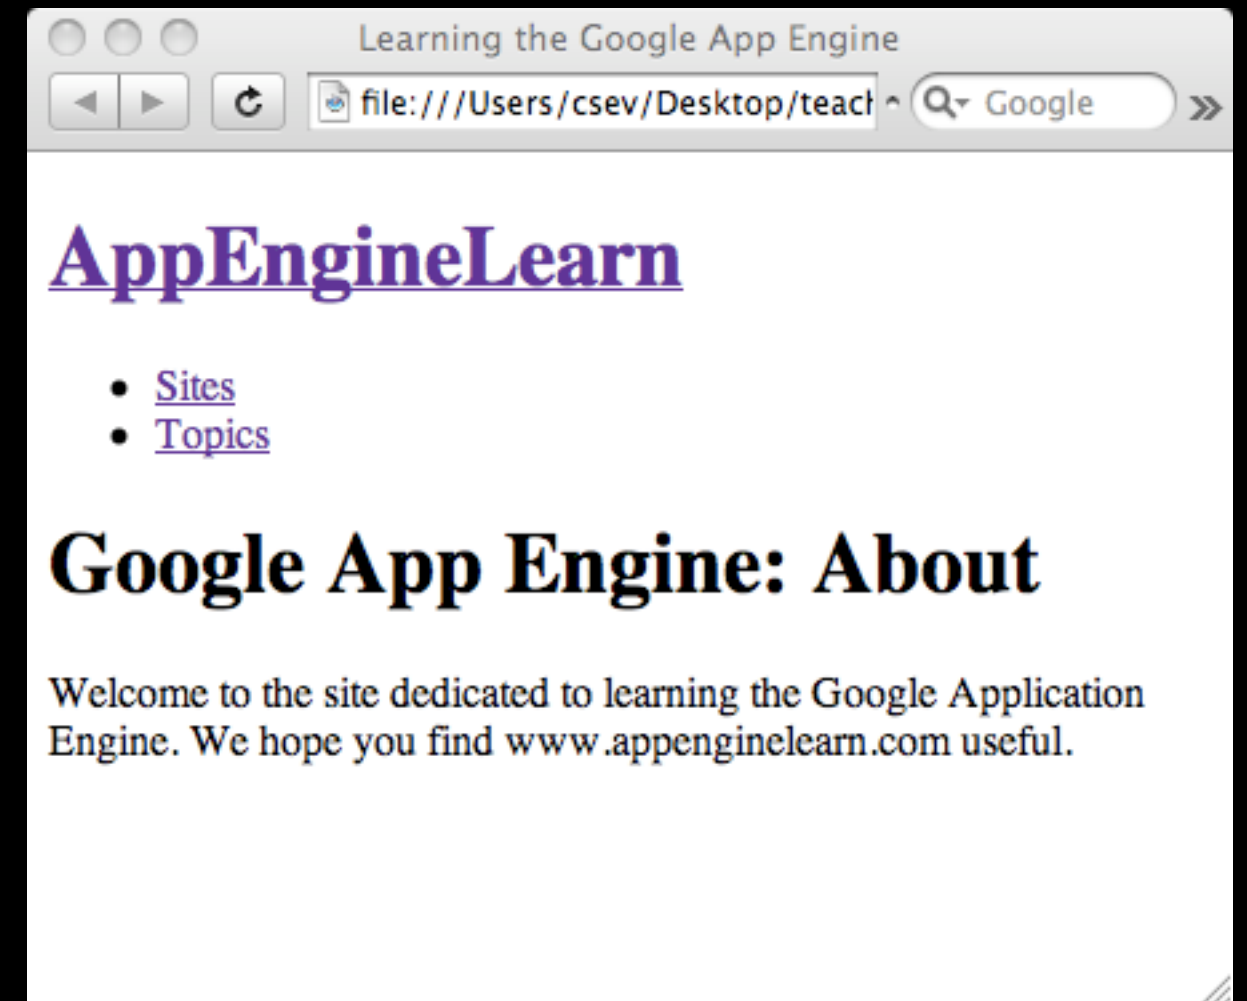

```
body {  
  font-family: arial, san-serif;  
}  
a, a:link  
{  
  color: #0000cc;  
}  
...
```

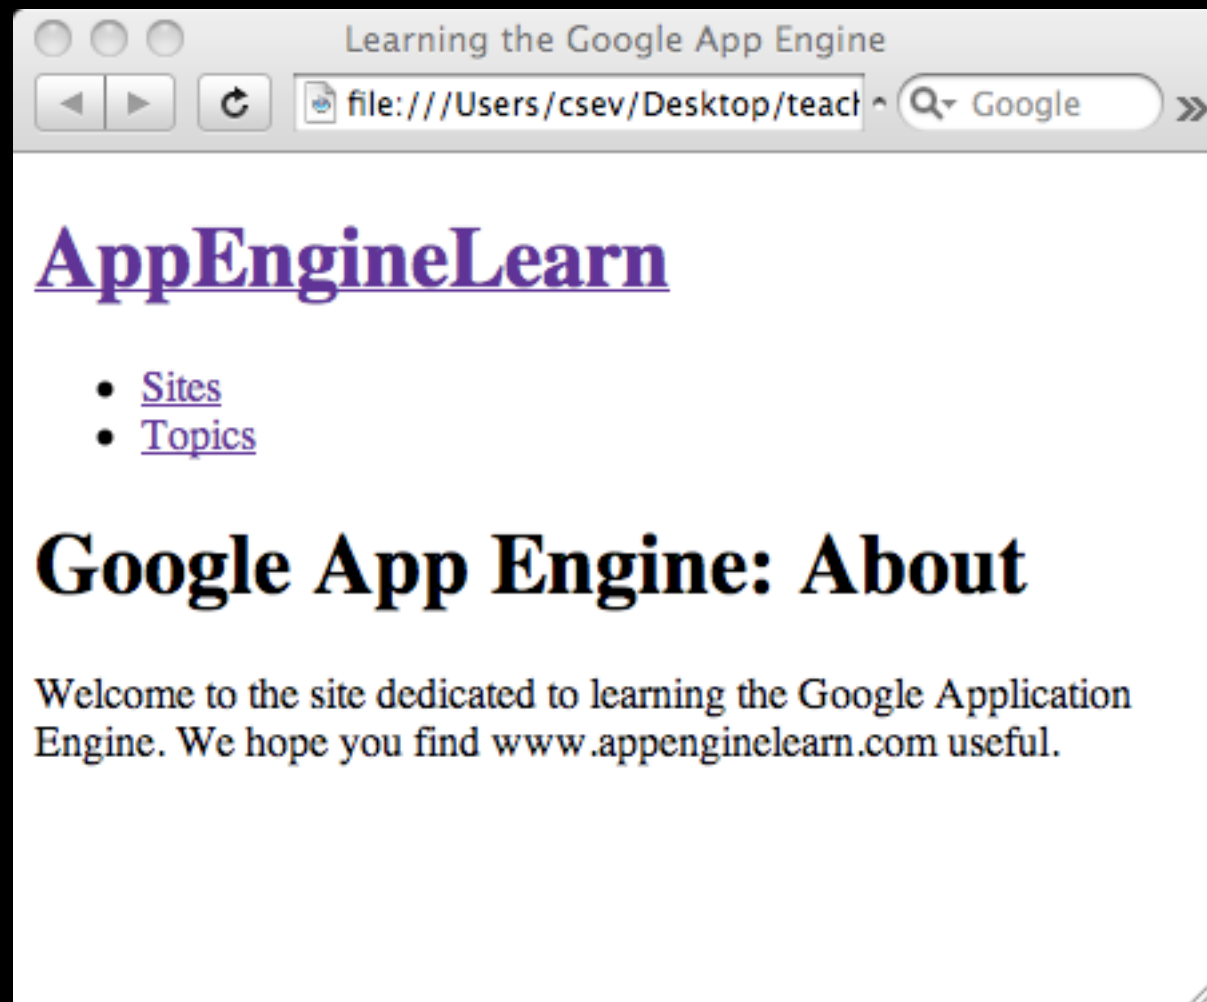

Applying Basic Styles

The Browser has “default styling” for all tags.

```
<h1><a href="index.htm">
  AppEngineLearn</a></h1>
<ul>
  <li><a href="sites.htm">Sites</a></li>
  <li><a href="topics.htm" >Topics</a></li>
</ul>
<h2>Google App Engine: About</h2>
<p>
Welcome to the site dedicated to
learning the Google Application Engine.
We hope you find
www.appenginelearn.com useful.
</p>
```

We will apply CSS to the tags in the document.

With no changes to the HTML.

Lots of CSS properties to play with

background-color, border-width, border-color, margin-top, padding, font-family, top, left, right, float, font-size, background-image, text-align, text-decoration, font-style, font-weight, vertical-align, visibility, overflow,

We can set these properties on any HTML tag in a document.

| background-repeat | |

Source: <http://www.lesliefranke.com/files/reference/csscheatsheet.html>

Anatomy of a CSS Rule

selector - which part of the document does this rule apply to

body

font-family: arial, sans-serif;

font-size: 100%; }

property - which aspect of CSS are we changing

value - What are we setting the property to.

Multiple tags with same styling

```
h1, h2, h3 {  
  color: yellow;  
  background-color: black;  
}
```

Making a noticeable background color is a fun way to debug / identify blocks.

Three ways to add style rules

- Inline Style - Add style information to a tag
- Embedded Style - Add style information to the document at the beginning
- External Style Sheet - Put all of your style in an external file
 - Preferred - because two people can work independently

<h1>

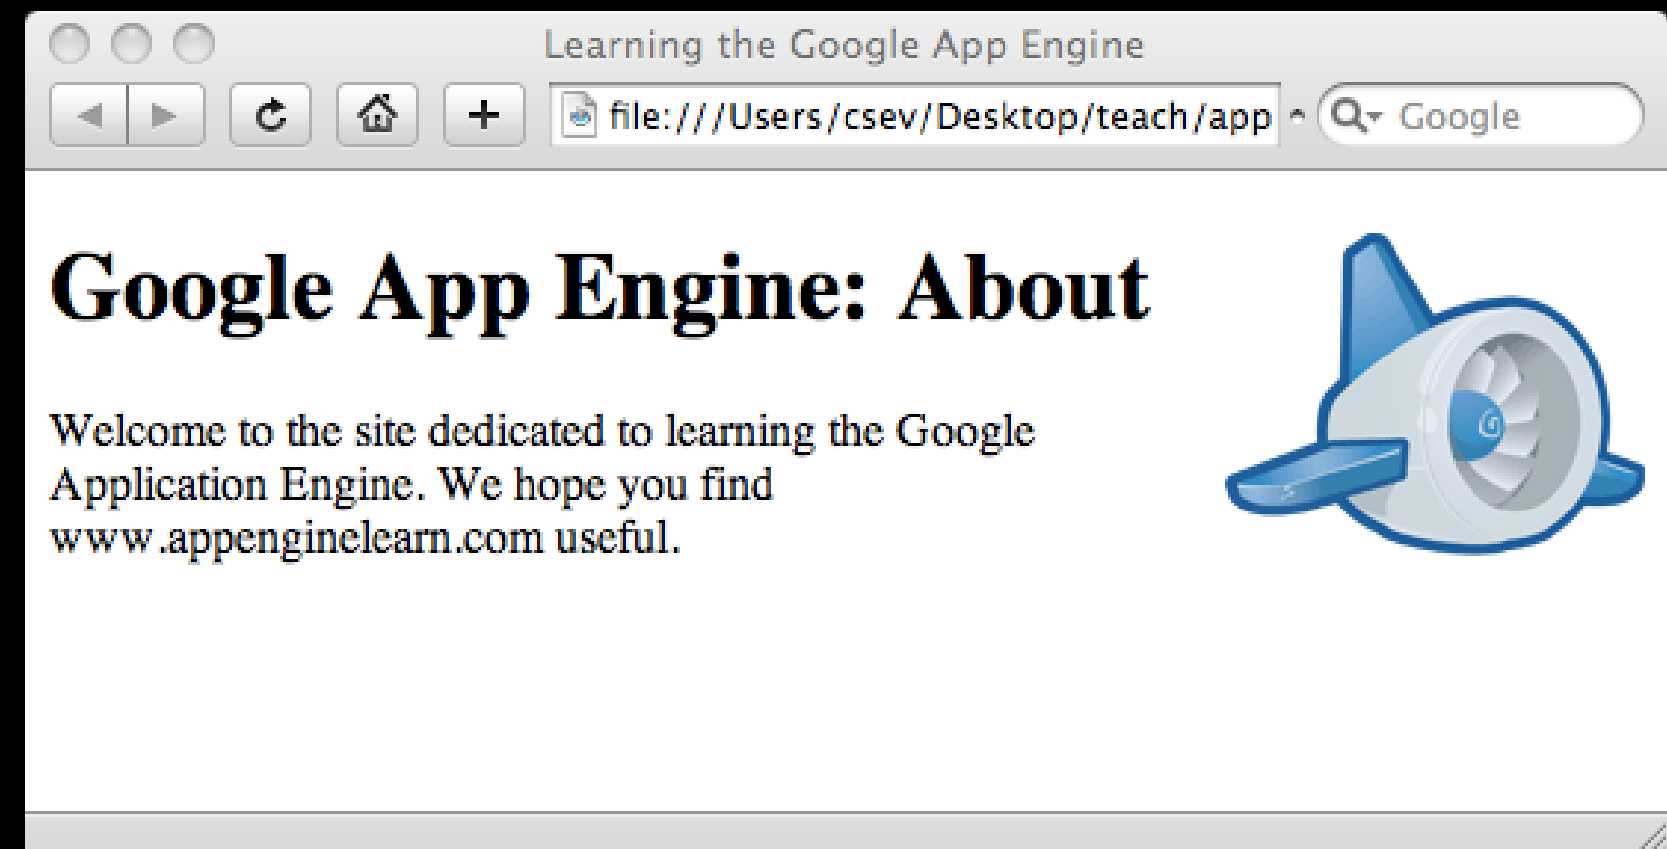

Google App Engine: About</h1>

<p>

Welcome to the site dedicated to
learning the Google Application Engine.
We hope you find
www.appenginelearn.com useful.

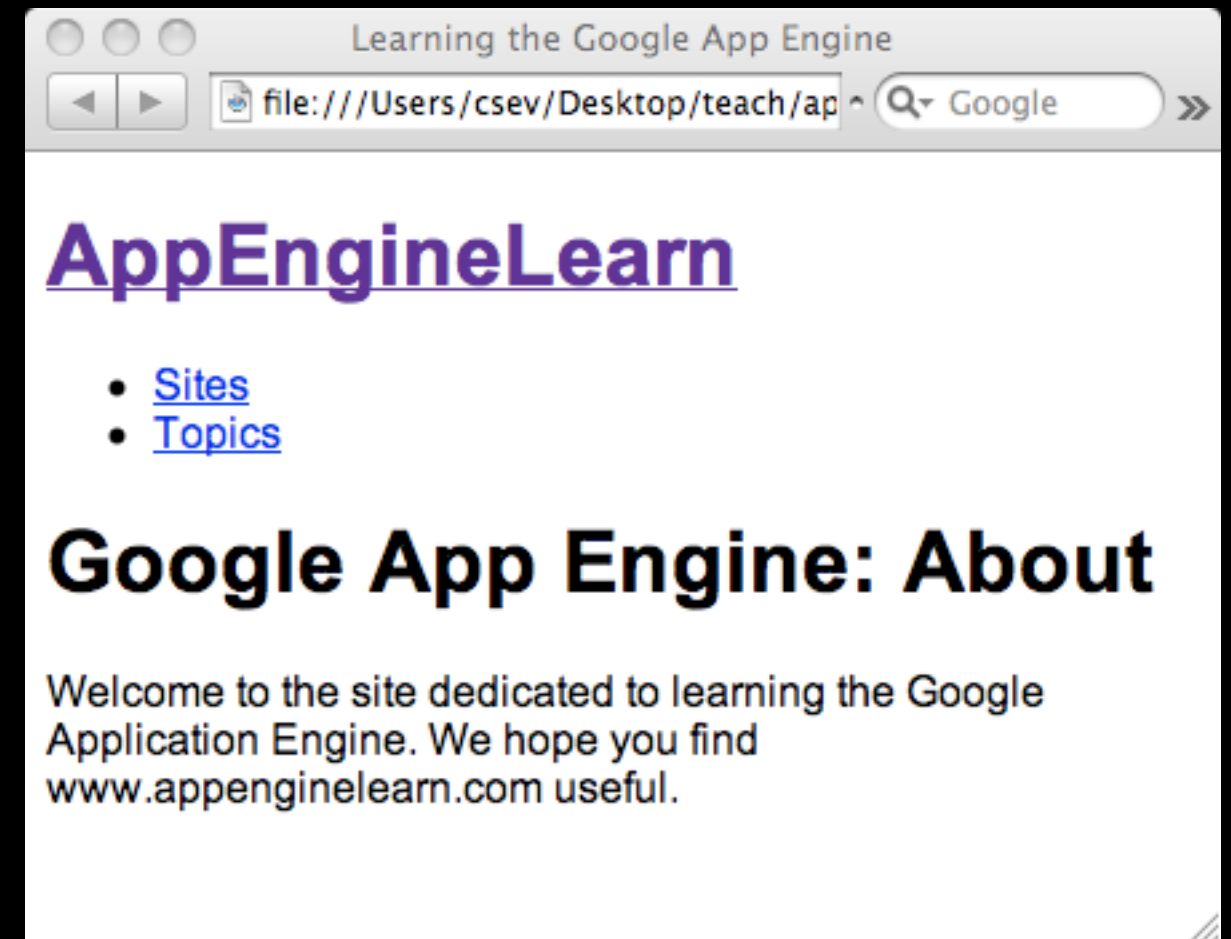

</p>

Inline Styles

Embedded Style

```
<html xmlns="http://www.w3.org/1999/xhtml"> <head>
  <title>Learning the Google App Engine</title>
  <style type="text/css">
    body {
      font-family: arial, sans-serif;
    }
  </style>
</head>
<body>
  <h1><a href="index.htm">
    AppEngineLearn</a></h1>
  <ul>
    <li><a href="sites.htm">Sites</a></li>
    <li><a href="topics.htm" >Topics</a></li>
  </ul>
```

External Style Sheets

```
<html xmlns="http://www.w3.org/1999/xhtml">
<head>
  <title>Learning the Google App Engine</title>
  <link type="text/css" rel="stylesheet" href="glike.css">
</head>
<body>
  <h1><a href="index.htm">
    AppEngineLearn</a></h1>
  <ul>
    <li><a href="sites.htm">Sites</a></li>
    <li><a href="topics.htm" >Topics</a></li>
  </ul>
```

glike.css:

```
body {
  font-family: arial, sans-serif;
}
```

```
<head>
  <title>Learning the Google App Engine</title>
  <link type="text/css" rel="stylesheet" href="glike.css">
</head>
```

```
csev$ ls -l
total 32
-rw-r--r--  1 csev  staff   44 Jan 28 13:14 glike.css-
rw-r--r--  1 csev  staff  680 Feb 17 08:25 index.htm-rw-
r--r--  1 csev  staff  886 Feb 17 08:00 sites.htm-rw-r--
r--  1 csev  staff  681 Feb 17 08:01 topics.htm
csev$
```

We put the CSS file in the same directory so the link works.

Fonts

- Default fonts are ugly and they have Serifs - which make them harder to read on a screen
- So the first thing I usually want to do is override the font in my document
- And I want to do this everywhere.

Header One

Paragraph about ugly default fonts.

Figure 3.5. Highlighting the serifs of a serif font (Georgia)

Fonts

Most Favourite

Least Favourite

```
body {  
  font-family: "Trebuchet MS", Helvetica, Arial, sans-serif;  
  font-size: x-large;  
}
```

Fallback fonts: serif, sans-serif, monospace, cursive and fantasy.

Font Factors

font-size:
xx-small
x-small
small
medium
large
x-large
xx-large

font-weight: bold or normal

font-style: normal or italic

text-decoration: none, underline, overline,
or line-through

Color Names

- W3C has listed 16 color names that will validate with an HTML validator.
- The color names are: aqua, black, blue, fuchsia, gray, green, lime, maroon, navy, olive, purple, red, silver, teal, white, and yellow.

Color Values

HTML colors can be defined as a hexadecimal notation for the combination of Red, Green, and Blue color values (RGB).

The lowest value that can be given to one light source is 0 (hex #00) and the highest value is 255 (hex #FF).

The table below shows the result of combining Red, Green, and Blue light sources:.

| Color | Color HEX | Color RGB |
|---|-----------|------------------|
|  | #000000 | rgb(0,0,0) |
|  | #FF0000 | rgb(255,0,0) |
|  | #00FF00 | rgb(0,255,0) |
|  | #0000FF | rgb(0,0,255) |
|  | #FFFF00 | rgb(255,255,0) |
|  | #00FFFF | rgb(0,255,255) |
|  | #FF00FF | rgb(255,0,255) |
|  | #C0C0C0 | rgb(192,192,192) |
|  | #FFFFFF | rgb(255,255,255) |

W3C Standard Color Names

W3C has listed 16 color names that will validate with an HTML validator.

The color names are: aqua, black, blue, fuchsia, gray, green, lime, maroon, navy, olive, purple, red, silver, teal, white, and yellow.

Source: http://www.w3schools.com/html/html_colors.asp

Colors by the number...

Three Numbers,
Red, Green , and
Blue - each from 00
- FF (Hexidecimal)

#e2edff

#edf = #eeddff

#ffffff = white
#000000 = black
#ff0000 = red
#00ff00 = green
#0000ff = blue

| Color Name | Color HEX | Color |
|--------------------------------|-------------------------|-------|
| AliceBlue | #F0F8FF | |
| AntiqueWhite | #FAEBD7 | |
| Aqua | #00FFFF | |
| Aquamarine | #7FFFD4 | |
| Azure | #F0FFFF | |
| Beige | #F5F5DC | |
| Bisque | #FFE4C4 | |
| Black | #000000 | |
| BlanchedAlmond | #FFEBCD | |
| Blue | #0000FF | |
| BlueViolet | #8A2BE2 | |
| Brown | #A52A2A | |

Default Styling for Links

Post-Click:

Hello there my name is Chuck.
Go ahead and click on here.

Downright Ugly!

Styling Links

```
a {  
  font-weight: bold;  
}  
a:link {  
  color: black;  
}  
a:visited {  
  color: gray;  
}  
a:hover {  
  text-decoration: none;  
  color: white;  
  background-color: navy;  
}  
a:active {  
  color: aqua;  
  background-color: navy;  
}
```

link - before a visit

visited - after it has been visited

hover - when your mouse is over it
but you have not clicked

active - you have clicked it and
you have not yet seen the new
page

Browser default styling for links is
downright ugly!

CSS Tags and Attributes

- As CSS was introduced they introduced two new tags that are pretty much there to serve as handles for styling
 - `<div>` - A block tag (breaks justification)
 - `` - An inline tag that does not break justification
- There are two attributes with special meaning to CSS
 - `id=` - Marks a unique block within the document for styling (use only once)
 - `class=` - Marks a non-unique tag within the document for styling (multi-use)

div as Container

```
<div>
```

```
<p>This is a paragraph inside a div.</p>
```

```
<p>So is this.</p>
```

```
</div>
```

The id attribute on the tag allows us to uniquely mark a div in a document. The id tag is also useful for screen readers.

```
<div id="header">
```

```
<ul>
```

```
<li><a href="sites.htm">Sites</a></li>  
href="topics.htm" >Topics</a></li>
```

```
</ul>
```

```
</div>
```

```
<li><a
```

“div” stands for “division” as it allows us to divide our page into parts or sections and then do something different with each “section”.

Everything within block

```
#footer {  
  font-style: italic;  
  font-family: Times, serif;  
}
```

or

Paragraphs within block

```
#footer p {  
  font-style: italic;  
  font-family: Times, serif;  
}
```

```
<div id="footer">  
  <p>Please send any comments to csev@umich.edu</p>  
</div>
```

id= identifies a **particular** block - only one in a document

Styling with class=

```
.fun {  
  color: #339999;  
  font-family: Georgia, Times, serif;  
  letter-spacing: 0.05em;  
}
```

class can be used many times in a document.

```
<p class="fun">A man walks into a bar; you  
would've thought he'd see it coming!</p>  
  <p>Have a nice day.<p>  
<p class="fun">More fun stuff</p>
```

Span (Invisible tag)

```
<p><span class="fun">Bubble Under</span> is a group of diving enthusiasts based in the south-west UK who meet up for diving trips in the summer months when the weather is good and the bacon rolls are flowing. We arrange weekends away as small groups to cut the costs of accommodation and travel and to ensure that everyone gets a trustworthy dive buddy.</p>
```

Sometimes you want to style something smaller than a whole block - then use `span`. Do not use `span` if you are applying something to a whole block - just put your styling on the enclosing block tag.

```
<body>
  <div id="header">
    <h1><a href="index.htm" class="selected">SI502</a></h1>
    <ul class="toolbar">
      <li><a href="books.htm">Books</a></li>
      <li><a href="topics.htm" >Topics</a></li>
    </ul>
  </div>
  <div id="bodycontent">
    <h1>Networked Computing: About</h1>
    <p>
      This course is a survey course covering a broad
      range of technology topics at a high level.
      The course is aimed at students with no prior
      technical skills other than the general use of
      a computer. Really!
    </p>
  </div>
</body>
```

When building HTML,
we use id and class to
add little “handles” in the
HTML to make it so we
can “style” areas of the
document.

**Pick div id's to
indicate meaning.**

A Running Example...

Transform from ugly to fancy with CSS

First: Just work with the tags and fix fonts / colors

```
<head>
  <title>Learning the Google App Engine</title>
  <link type="text/css" rel="stylesheet" href="glike.css">
</head>
```

```
body {
  font-family: arial, sans-serif;
}
a {
  color: blue;
}
h1 a {
  text-decoration: none;
  color: black;
}
```

Block Layout

Sakai and uPortal at UNISA - Johan van den Berg

Produced: June 6, 2006 This video was taped while are the Sakai meeing in Vancouver. Johan discusses their upcoming project to integrate uPortal and Sakai to produce the UNISA campus portal. Johan attended both the Sakai and JA-Sig meetings and descibed the UNISA approach to both cmmunities. Details: 3 minutes, Windows Media 300 kbps.

This is a randomly selected show

Done

Source: www.dr-chuck.com

Two kinds of elements

- **Inline** - affects how text looks
 - strong, span
- **Block** - Containers that can be laid out
 - Paragraphs, etc
- CSS can change a tag from inline to block

```
#navigation li {  
    display: inline;  
}
```

Inline Elements

- Flowed with other text
- span, em, strong, cite, a
- Inline tags can be nested as long as they match
 - `<cite>Stuff</cite>`
- Block can contain inline - but inline cannot contain block

}

#header li {
  font-size: 14px;
  display: inline;
}

#header ul {
  list-style: none;
  float: right;
  vertical-align: middle;
}

```

Now lets do some “tweaking”

CSS Box Model

- **height** and **width** properties size the block element
- **margin** properties define the space around the block element
- **border** properties define the borders around a a block element
- **padding** properties define the space between the element border and the element content
- **background** properties allow you to control the background color of an element, set an image as the background, repeat a background image vertically or horizontally, and position an image on a page

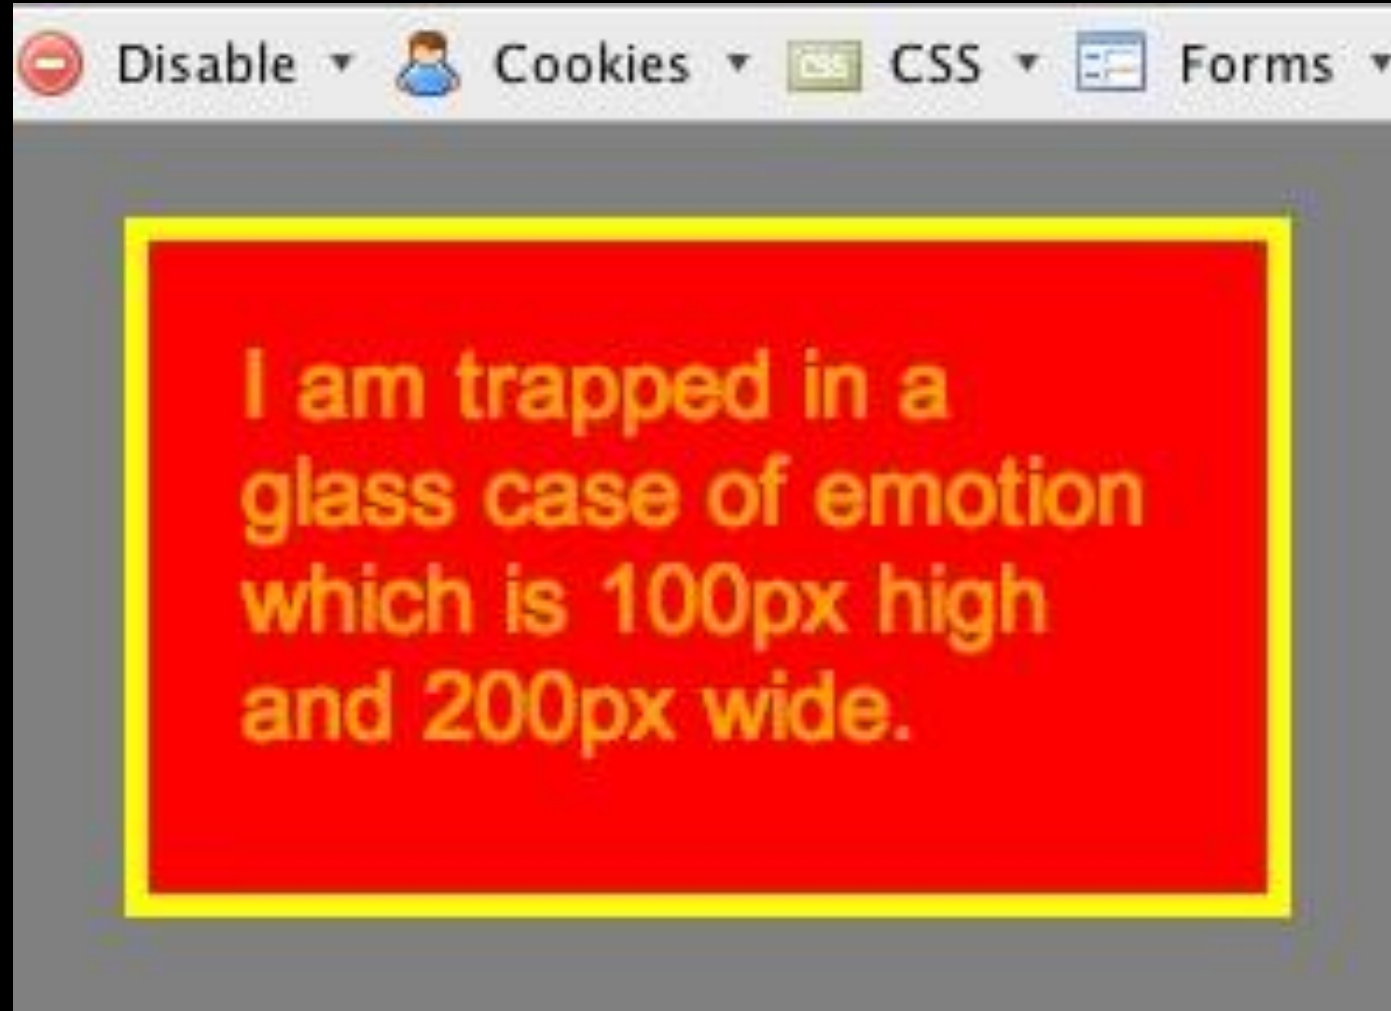

<http://reference.sitepoint.com/css/boxmodel>

```
.trapped {
  height: 100px;
  width: 200px;
  margin: 20px;
  border: 5px solid yellow;
  background:red;
  padding: 20px;
  font-family:Arial;
  color:orange;
  font-size:20px;
}
```

```
<p class="trapped">
```

```
I am trapped in a glass case of emotion
which is 100px high and 200px wide.
```

```
</p>
```

The Box Model

```
.trapped {  
  height: 50px;  
  width: 50px;  
}  
.trapped2 {  
  height: 50px;  
  width: 50px;  
  border: 5px solid yellow;  
  padding: 10px;  
}
```

```
<p class="trapped">
```

```
One</p>
```

```
<p class="trapped2">
```

```
Two</p>
```

Border, padding, and margin are additive.

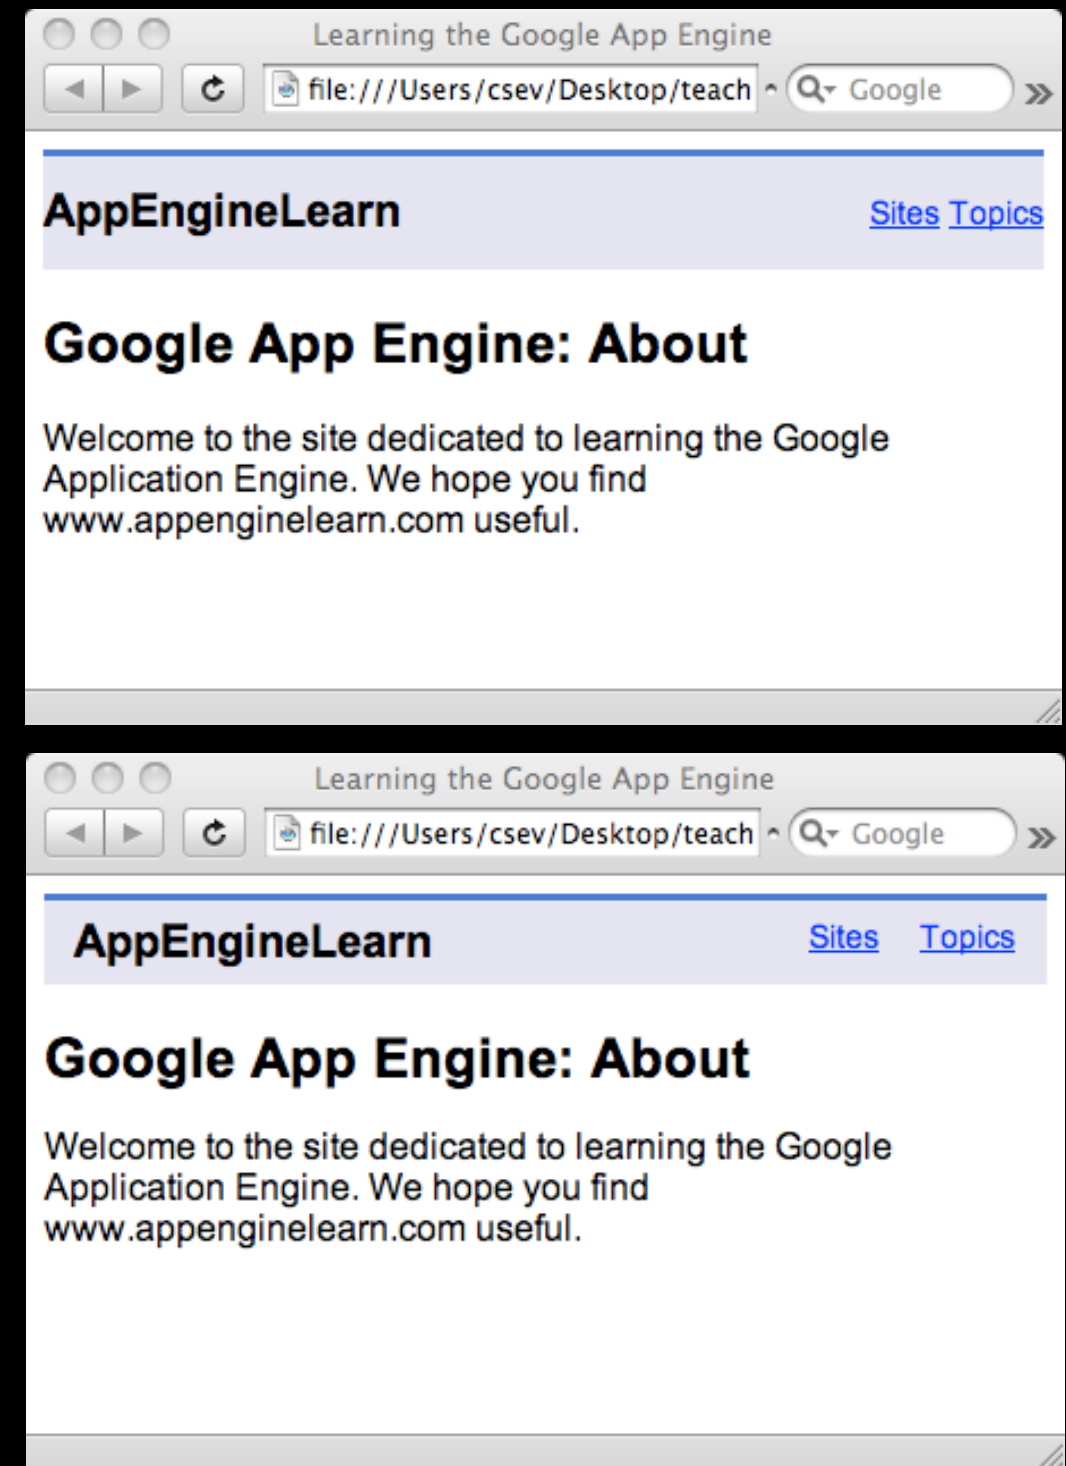

```
#header {
  background-color: #dde;
  border-top: 3px solid #36c;
  height: 100%;
  overflow: hidden;
  padding: 7px;
  margin-top: 5px;
}

#header h1 {
  font-size: 20px;
  float: left;
  vertical-align: middle;
  margin: 0;
  padding: 0 0 0 .3em;
}
```

top, right, bottom, left

```
#header li {
  font-size: 14px;
  display: inline;
  padding: .5em;
}

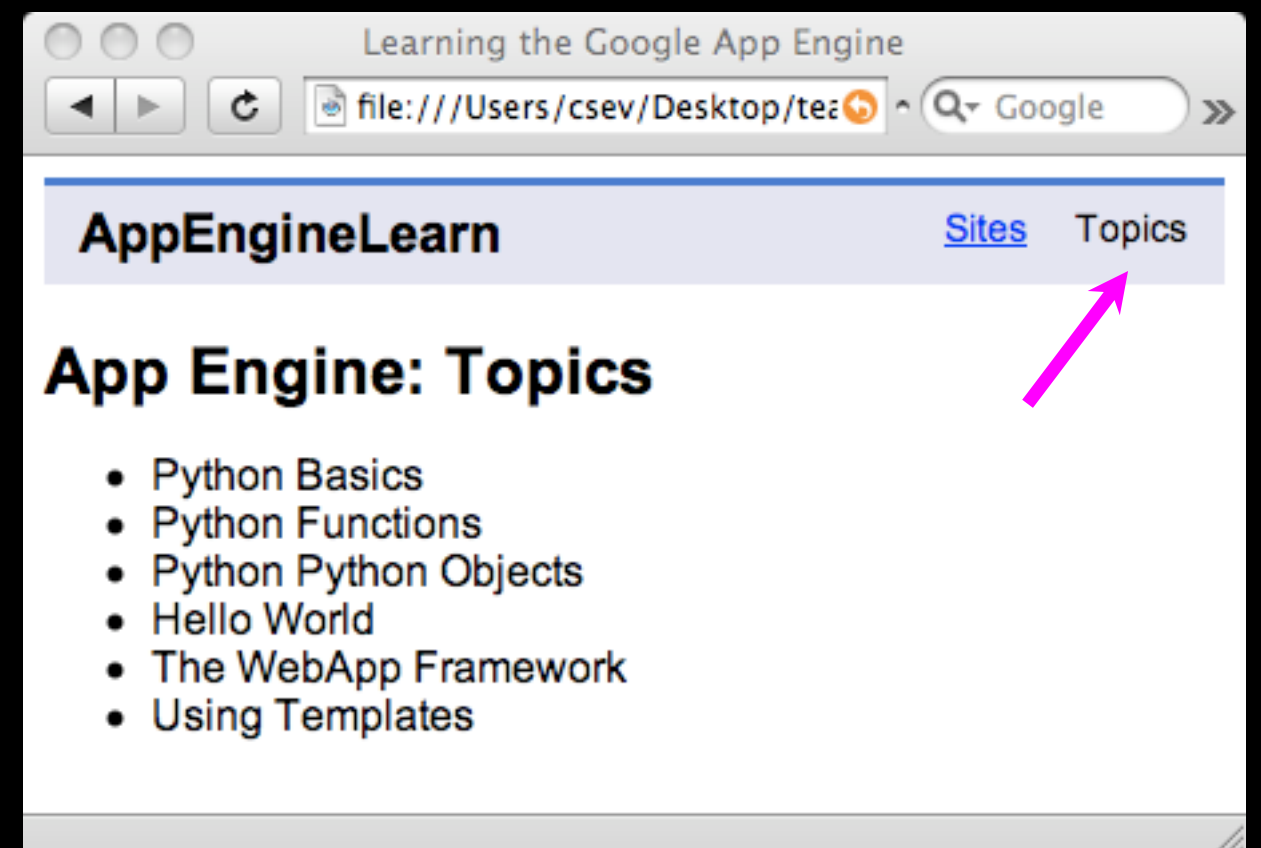

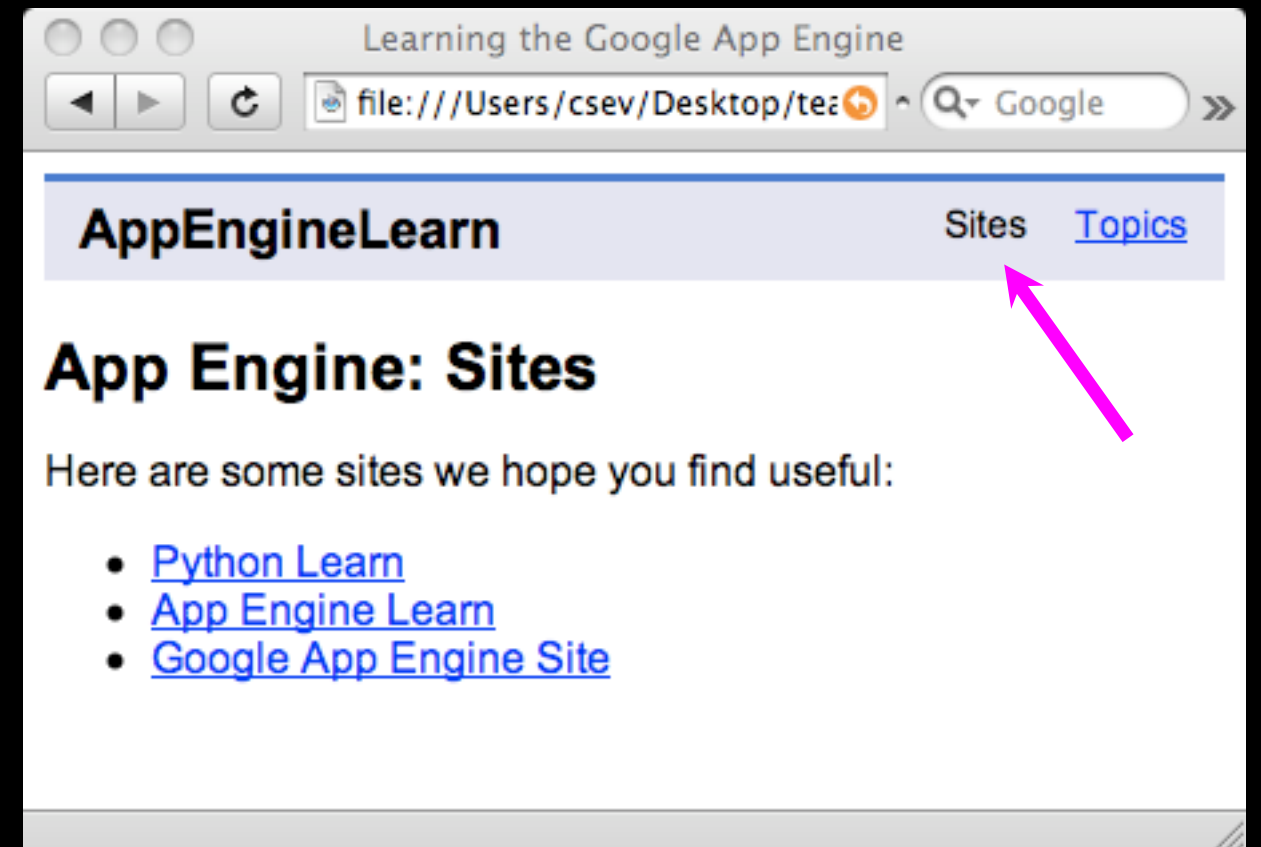

#header ul {
  list-style: none;
  text-align: right;
  float: right;
  vertical-align: middle;
  margin: 0;
  padding: 0;
}
```

```
<div id="header">
  <h1><a href="index.htm">AppEngineLearn</a></h1>
  <ul>
    <li><a href="sites.htm" class="selected">Sites</a></li>
    <li><a href="topics.htm" >Topics</a></li>
  </ul>
</div>
```

```
#header li a.selected {
  color: black;
  text-decoration: none;
}
```

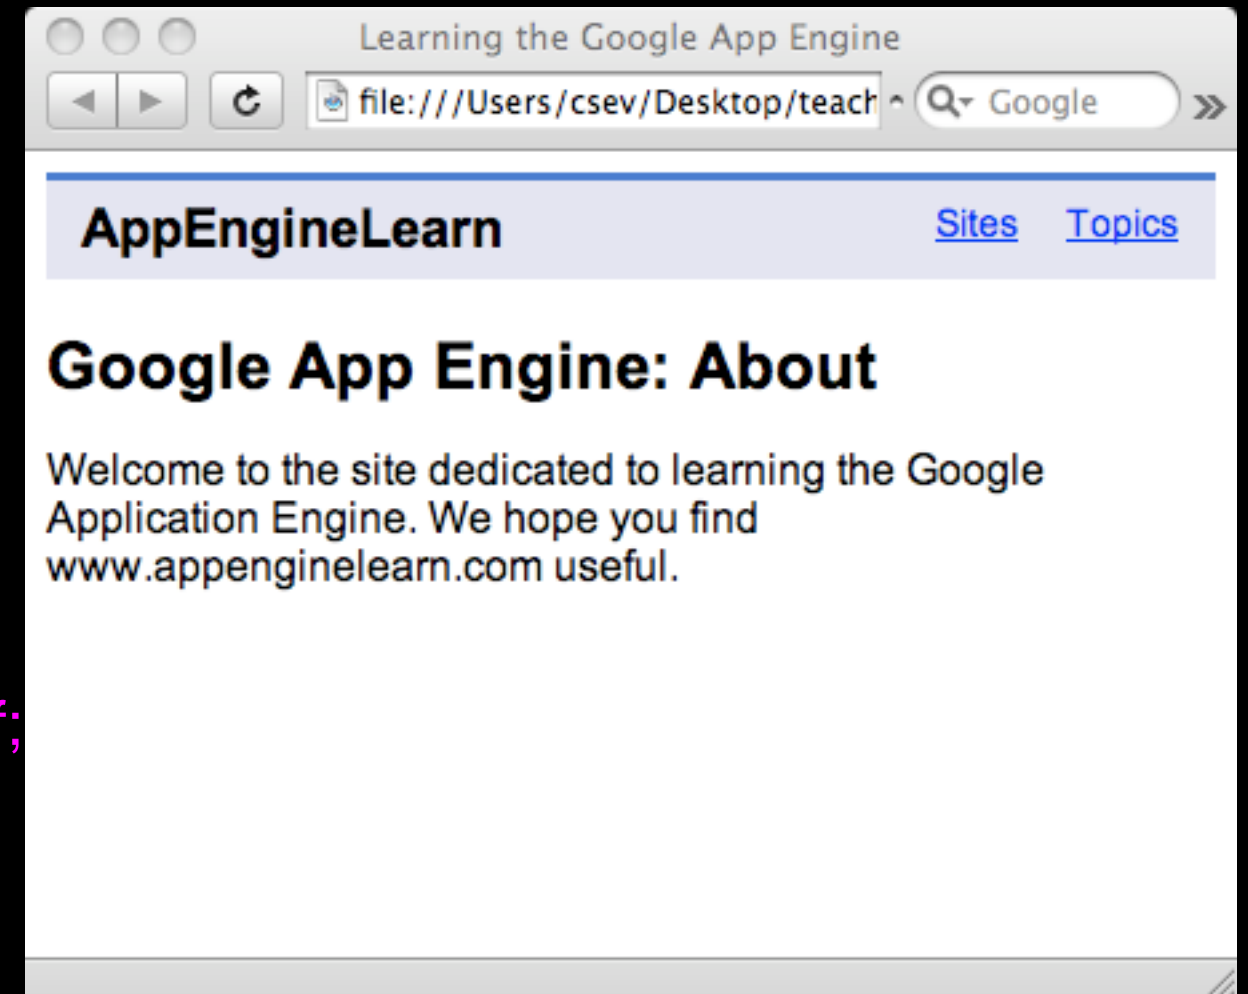

```
<div id="header">
  <h1><a href="index.htm">AppEngineLearn</a></h1>
  <ul>
    <li><a href="sites.htm">Sites</a></li>
    <li><a href="topics.htm" class="selected">Topics</a></li>
  </ul>
</div>
```

Transforming the look and feel of a page using a CSS style sheet.

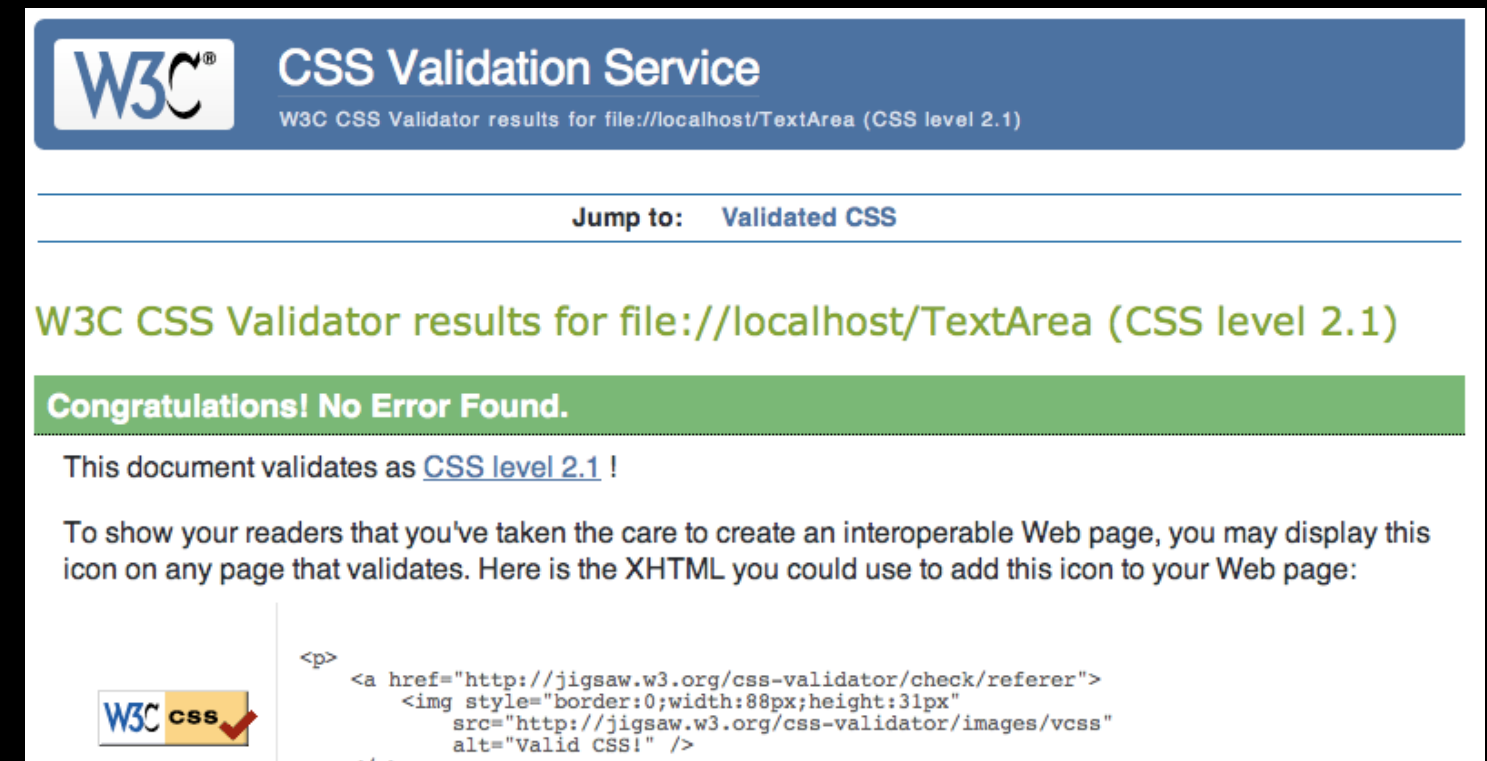

```
body {  
  font-family: arial, san-serif;  
}  
a, a:link  
{  
  color: #0000cc;  
}  
...
```

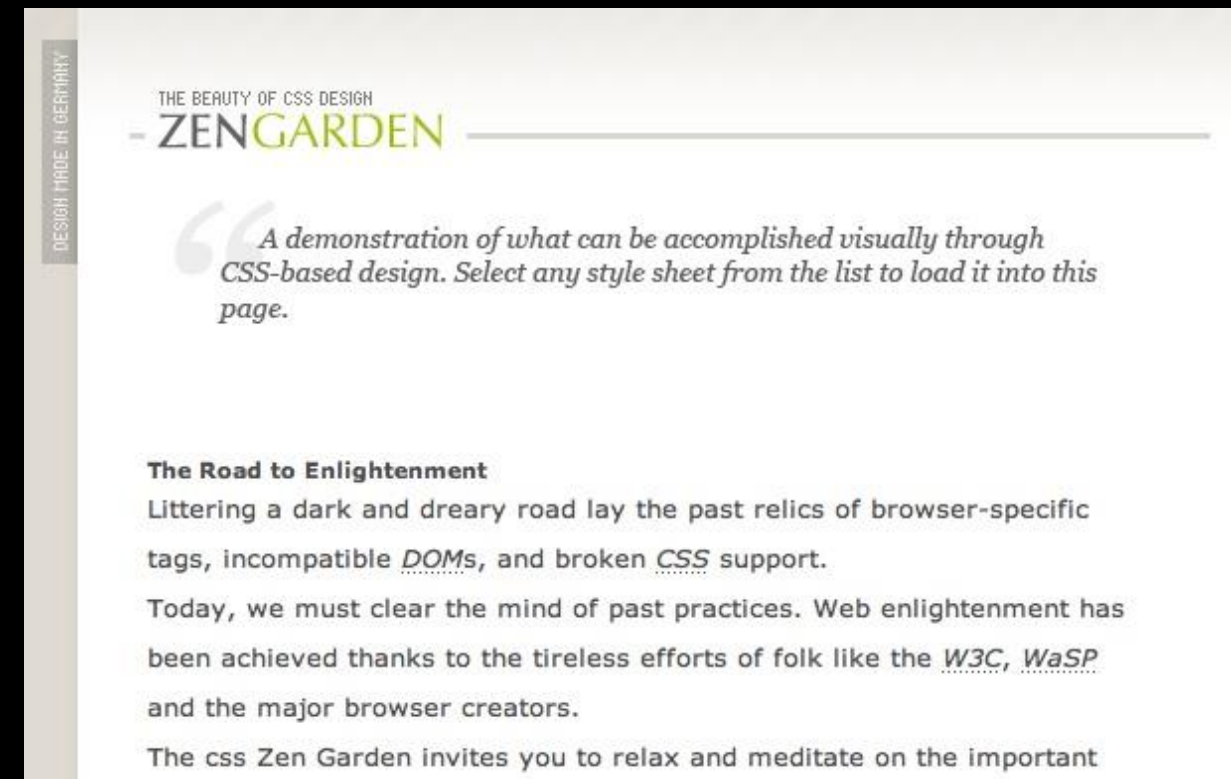

CSS Validation

- You can validate your CSS to make sure it has no syntax errors
- Browsers will generally quietly ignore bad CSS syntax
- <http://jigsaw.w3.org/css-validator>
- The validator can save you time and sanity

Zen Garden

- A social site where CSS designers show their “stuff”
- The HTML never changes - only the CSS
- Inspiration for us designers

Summary

- CSS Layout is its own art and science
- CSS Basics are well established and well supported in all modern browsers
- The box model is pretty straightforward - and allows nice design within the standards with reasonable effort levels.
- Site layout and markup is further evolving - mostly to make it increasingly possible to support desktop like experiences on the web.
- These innovations will naturally cause incompatibilities - which make things interesting and frustrating at times.
